

UTC Project Information	
Project Title	MPC-662 – Impacts of Wildfire Smoke and Other Area-Wide Air Pollution on Multimodal Traffic Volumes
University	Utah State University
Principal Investigator	Patrick A. Singleton, Ph.D. Keunhyun Park, Ph.D.
PI Contact Information	<p>Patrick A. Singleton, Ph.D. Assistant Professor Department of Civil and Environmental Engineering Utah State University 4110 Old Main Hill, Logan, UT 84322-4110 Phone: (435) 797-7109 Email: patrick.singleton@usu.edu ORCID: 0000-0002-9319-2333</p> <p>Keunhyun Park, Ph.D. Assistant Professor Department of Landscape Architecture and Environmental Planning Utah State University 4005 Old Main Hill, Logan, UT 84322-4005 Phone: (435) 797-0225 Email: keunhyun.park@usu.edu ORCID: 0000-0001-5055-7833</p>
Funding Source(s) and Amounts Provided (by each agency or organization)	<p>USDOT, Office of the Assistant Secretary for Research and Technology \$90,000</p> <p>Utah Department of Transportation \$65,000</p> <p>Utah State University \$25,000</p>
Total Project Cost	\$180,000
Agency ID or Contract Number	69A3551747108
Start and End Dates	August 24, 2021 to July 31, 2022
Brief Description of Research Project	Increasing episodes of area-wide air pollution – from wildfire smoke and other sources – in urban and rural communities in the western/central US suggest a need for transportation infrastructure managers to understand how traffic patterns across multiple transportation modes are affected by these air pollution events. This project studies the effects of wildfire smoke and other area-wide air pollution on multimodal traffic volumes in Utah by analyzing multiple fused traffic, air quality, weather, and geospatial data sources. First, we quantify how much and for how long air pollution impacts multimodal traffic volumes (motor vehicle volumes, transit ridership, and bicycle/pedestrian counts) after controlling for other factors, such as

	<p>weather. Second, we identify how air pollution results in aggregate-level travel behavior changes, such as mode share adjustments, shifts of trips to later days, or changes in vehicle miles traveled. Third, we characterize spatial variations in how air pollution impacts multimodal traffic volumes and aggregate travel behavior changes. This information could be used by transportation agencies to manage infrastructure operations and to prepare for and mitigate any traffic impacts and mode shifts due to smoke from wildfires, wintertime inversions, and other area-wide pollution events.</p>
